CONTEXT
As the protracted crisis in North-East Nigeria progressed in its tenth year in 2019, humanitarian needs in Borno, Adamawa and Yobe (BAY) States remain dire and multi-faceted. The conflict has resulted in 7.1 million individuals in need of humanitarian assistance¹. 80% of internally displaced persons (IDPs) are located in Borno State only, with a majority living in urban host communities. In addition to this humanitarian landscape in accessible areas, most recently the humanitarian community has identified around 1,000,000 individuals staying in hard-to-reach areas with little hope to be reached by humanitarian assistance².

To respond to persisting information gaps on humanitarian needs severity and to inform further the 2020 response planning, United Nations Office for Coordination of Humanitarian Affairs (OCHA)’s Inter-Sector Working Group (ISWG), with support from REACH, conducted a Multi-Sector Needs Assessment in the BAY States. Data collection took place between June 17th and July 30th 2019.

METHODOLOGY
Data collection comprised of a total of 8,019 household (HH) interviews. This assessment used a two-stage cluster sampling designed to collect data with a confidence level of 90% and a margin of error of 10% for all accessible areas within a Local Government Area (LGA) (not generalizable for each population group at LGA level). In Borno State, 3,160 surveys were kept for final analysis after cleaning.

The Borno State level factsheet mostly presents composite analysis at the sectoral and inter-sectoral level, such as living standards gaps (LSG) in food security & livelihoods, water, sanitation & hygiene (WASH), health, shelter, education, protection, early recovery & livelihoods; in addition to inter-sectoral composite indicators such as a vulnerability index, an impact indicator and a coping capacity gap indicator. Indicators feeding into the composite analysis have been selected together with relevant sectors and/or inter-sectoral coordination platforms.

Please find a more detailed methodology section in Annex 1 of this factsheet.

Assessment sample
Households: 3,160
- IDP: 1,071
- Returnee: 1,024
- Non-displaced: 1,065

Local Government Areas: 22 (out of 27)³

Demographics highlights
Female-headed households: 21%
Average household size: 5.8
Child-headed households: 4%
HH including chronically ill/disabled member: 5%

MULTI-SECTORAL NEEDS INDEX (MSNI)

% of households with a MSNI severity score of at least 3: 72%

The MSNI is the final decision tree analysis from the MSNA analytical framework that allows for categorization of household severity of needs. It aims to measure households’ overall severity of humanitarian needs vis-à-vis their living standards, capacity gaps, and impact. It estimates severity of humanitarian needs (intensity) and proportion of households in each severity category (magnitude).

1 OCHA, 2019 Humanitarian Needs Overview
2 OCHA, 2020 Global Humanitarian Overview
3 Only 22 out of 27 LGAs in Borno State could be assessed due to access constraints / lack of partners active in these LGAs.
4 Figure obtained by applying the percentage on the population figure used for the Nigeria 2019 MSNA sample (using Vaccination Tracking System, IOM Displacement Tracking Matrix datasets).

see Annex 1 for details on methodology

% of households with an FSL LSG severity score of at least 3: 27%

% of households per FSL LSG severity score:

1% Extreme (severity score 4)
26% Severe (severity score 3)
43% Stress-level (severity score 2)
30% No or minimal (severity score 1)

% of households with an FSL LSG severity score of at least 3, per population group:

Non-displaced 22%
Returnees 35%
IDPs 34%

The indicators primarily driving the severe and extreme LSG severity scores for FSL were barriers to accessing food, access to a market and poor food consumptions scores. Across Borno, commonly reported barriers to accessing food included food being too expensive, the market being too far, and no distributions available. In East and Northern Borno LGAs, due to movement restrictions and limited supplies, access to markets and food was reported as difficult.

% of households with an FSL LSG severity score of at least 3, per population group:

Non-displaced
Returnees
IDPs

% of households with an FSL LSG severity score of at least 3, in Borno State:

% of HHs with a FSL living standards gap severity score of 3-4

High
Low

1 The FSL composite indicator consists of food consumption, reduced coping strategy index, primary source of fuel, barriers to accessing food, access to land and agriculture inputs.
2 Figure obtained by applying the percentage on the population figure used for the Nigeria 2019 MSNA sample (using Vaccination Tracking System, IOM Displacement Tracking Matrix datasets).
WATER, SANITATION & HYGIENE (WASH) LIVING STANDARDS GAP (LSG)

% of households with a WASH LSG severity score of at least 3: 44% # of households with a WASH LSG severity score of at least 3: 335,483

% of households per WASH LSG severity score:

10% Extreme (severity score 4)
34% Severe (severity score 3)
42% Stress-level (severity score 2)
14% No or minimal (severity score 1)

% of households with a WASH LSG severity score of at least 3, per population group:
- Non-displaced: 52%
- Returnees: 26%
- IDPs: 36%

The indicators primarily driving the severe and extreme LSG severity scores for WASH were the use of unimproved water sources, practice of open defecation by children, and lack of hand soap. In Southern Borno, there was a high use of surface water, open wells and mai moya (water vendor). A high percentage of households in this area reported only using water when washing hands. The practice of open defecation was reported widespread among children throughout Borno.

% of households with a WASH LSG severity score of at least 3, in Borno State:

The indicators primarily driving the severe and extreme LSG severity scores for WASH were the use of unimproved water sources, practice of open defecation by children, and lack of hand soap. In Southern Borno, there was a high use of surface water, open wells and mai moya (water vendor). A high percentage of households in this area reported only using water when washing hands. The practice of open defecation was reported widespread among children throughout Borno.

The WASH composite indicator consists of water source, access to latrine and use of hand soap.

The indicators primarily driving the severe and extreme LSG severity scores for WASH were the use of unimproved water sources, practice of open defecation by children, and lack of hand soap. In Southern Borno, there was a high use of surface water, open wells and mai moya (water vendor). A high percentage of households in this area reported only using water when washing hands. The practice of open defecation was reported widespread among children throughout Borno.

% of households per WASH LSG severity score, per population group:

The indicators primarily driving the severe and extreme LSG severity scores for WASH were the use of unimproved water sources, practice of open defecation by children, and lack of hand soap. In Southern Borno, there was a high use of surface water, open wells and mai moya (water vendor). A high percentage of households in this area reported only using water when washing hands. The practice of open defecation was reported widespread among children throughout Borno.
The indicators primarily driving the severe and extreme LSG severity scores for health were barriers to accessing health services, long distances to health facilities and risk of unsafe births. Across Southern Borno, the most commonly reported barriers to accessing health were that services and medicine were too expensive. In the majority of East Borno LGAs, a large portion of households reported that they did not have a skilled attendant present when women gave birth.

% of households per health LSG severity score:

The indicators primarily driving the severe and extreme LSG severity scores for health were barriers to accessing health services, long distances to health facilities and risk of unsafe births. Across Southern Borno, the most commonly reported barriers to accessing health were that services and medicine were too expensive. In the majority of East Borno LGAs, a large portion of households reported that they did not have a skilled attendant present when women gave birth.

% of households with a health LSG severity score of at least 3, in Borno State:

The health composite indicator consists of barriers to accessing health, distance to health facilities, illnesses, maternal health and immunization.

Figure obtained by applying the percentage on the population figure used for the Nigeria 2019 MSNA sample (using Vaccination Tracking System, IOM Displacement Tracking Matrix datasets).
The shelter composite indicator consists of type of shelter, ownership of shelter and damage to shelter. Figure obtained by applying the percentage on the population figure used for the Nigeria 2019 MSNA sample (using Vaccination Tracking System, IOM Displacement Tracking Matrix datasets).

### % of households per shelter LSG severity score:

- Extreme (severity score 4): 6%
- Severe (severity score 3): 28%
- Stress-level (severity score 2): 47%
- No or minimal (severity score 1): 19%

### % of households with a shelter LSG severity score of at least 3, per population group:

- Non-displaced: 22%
- Returnees: 38%
- IDPs: 54%

The indicators primarily driving the severe and extreme LSG severity scores for shelter were lack of adequate shelters and severity of damage of shelters. In Dikwa, Mafa and Bama LGAs, a high percentage of households reported living in tents, and emergency or makeshift shelters. The same LGAs reported high levels of damage to shelters; and high levels of households in Mobbar, Monguno, Gwoza and Kala/Balge LGAs reported shelters that were completely destroyed.

### % of households with a shelter LSG severity score of at least 3, in Borno State:

- Extreme: 6%
- Severe: 28%
- Stress: 47%
- Minimal: 19%

% of households with a shelter LSG severity score of at least 3: 34%

% of households per shelter LSG severity score, per population group:

- Non-displaced: 22%
- Returnees: 38%
- IDPs: 54%

see Annex for details on methodology
The education composite indicator consists of children currently attending education, children who have never attended formal education, barriers to accessing education.

Figure obtained by applying the percentage on the population figure used for the Nigeria 2019 MSNA sample (using Vaccination Tracking System, IOM Displacement Tracking Matrix datasets).

The indicators primarily driving the severe and extreme LSG severity scores for education were children out of school (formal and informal) and barriers to accessing education. In Gubio, Magumeri, and Dikwa LGAs, a high percentage of households reported no children in the household attending any kind of education. Across Borno, the most commonly reported barriers to accessing education were school fees, uniforms and distance to school.

% of households with an education LSG severity score of at least 3: 28%

The protection composite indicator consists of experience of security incidents, movement restrictions, loss of documentation, risk of human trafficking, risk of eviction, missing family members and psychosocial distress. 📌 Figure obtained by applying the percentage on the population figure used in Nigeria 2019 MSNA sample (using Vaccination Tracking System, IOM Displacement Tracking Matrix datasets). 📌 Low protection needs can be explained by various reasons as mentioned in the box on p.12. 📌 Discrepancy between the overall MSNI severity scores 3 and 4 percentage and the category disaggregation is due to rounding to the unit.

% of households with a protection LSG severity score of at least 3: 3%

% of households per protection LSG severity score:

- Non-displaced: 1%
- Returnees: 4%
- IDPs: 5%

The indicators primarily driving the severe and extreme LSG severity scores for protection were movement restrictions, missing family members, and loss of documentation. In East and Northern Borno LGAs, a high percentage of households reported movement restrictions at night and missing family members, both children and adults. Throughout Borno, high proportions of households reported having lost legal documentation for both adults and children, such as birth certificates.

% of households with a protection LSG severity score of at least 3, per population group:

% of households with a protection LSG severity score of at least 3, in Borno State:

- Non-displaced: 1%
- Returnees: 4%
- IDPs: 5%

% of households per protection LSG severity score, per population group:
The indicators primarily driving the severe and extreme LSG severity scores for ERLS were high levels of debt, no source of income, limited access to government services, and no physical cash. East and Northern Borno LGAs had the highest proportions of households reporting no source of income or cash, due to displacement and a breakdown of traditional livelihoods.
The coping gap composite indicator consists of the reduced Coping Strategy Index, main strategies for insufficient water, income and fuel, medical treatment, and NFI needs. The indicators primarily driving the severe and extreme severity scores for the capacity gap were negative coping strategies for insufficient water, lack of income, and low reduced Coping Strategy Index (rCSI) score. The most commonly reported strategies for lack of income included spending savings, borrowing money, and purchasing food on credit. Additionally, the most commonly reported strategies for lack of water included reduce the use of water for washing, and fetching water from farther away.

The indicators primarily driving the severe and extreme severity scores for the capacity gap were negative coping strategies for insufficient water, lack of income, and low reduced Coping Strategy Index (rCSI) score. WELL-BEING: MALNUTRITION & EXPLOITATION RISK

Borno State Global Acute Malnutrition (GAM) rates for 0-59 months infants, per livelihood domain (secondary data): 23

- MMC & Jere: 12.5%
- Central Borno: 10.4%
- East Borno: 12.3%
- Southern Borno: 10.0%
- Borno overall: 11.2%

Damboa, Monguno, and Bama LGAs showed the highest proportions of HHs presenting a risk of labour exploitation:

- 39% of HHs in Damboa, 31% of HHs in Monguno mentioned that someone in the HH worked for someone else without getting paid.
- 10% of HHs in Bama and Monguno mentioned that someone in the HH received less payment than promised for work.
- 15% of HHs in Damboa, 8% of HHs in Monguno mentioned that someone in the HH worked excessive hours.

VULNERABILITIES 24

% of households per vulnerability severity score:

- 16% Vulnerable
- 84% Not vulnerable

% of households with a vulnerability severity score, per population group:

- Non-displaced: 13%
- Returnees: 23%
- IDPs: 19%

The indicators primarily driving vulnerability in Borno were a high percentage of female- and child-headed households and a high age dependency ratio. The LGAs with the highest proportions of vulnerable households were Kala/Blage, Gubio, and Gwoza.

IMPACT 25

Borno overall

% of households per impact severity score:

- Extreme: 11.2%
- Severe: 10.0%
- Stress-level: 12.3%
- No or minimal: 5.5%

% of households with an impact severity score of at least 3, per population group:

- Non-displaced: 0%
- Returnees: 0%
- IDPs: 18%

The indicators primarily driving the severe impact severity score were no access to phone network, communities living in an area with facilities affected by conflict and households reporting movement restrictions.

23 Secondary data provided by the Nutrition Sector, data from May 2019.

24 The vulnerability criteria consists of isolated, female-headed, child-headed HHs, age dependency ratio, HHs including a chronically ill or disabled member, HHs living in food insecure area.

25 The impact composite indicator consists of indicators looking at impact on people, on systems and services, and on access to aid. See final report for more detailed indicators.
Most common needs profiles of households found to have LSG severity scores of at least 3 (% of households):

% of households with LSG severity scores of at least 3 in one or more sectors, per population group:

As observed on the radar graph above, while the sectoral LSG composite indicator for Protection was informed by the Protection sector and sub-sectors, it resulted in low % overall and compared to other sectoral LSG. Explanations for this include:

- General under-reporting of protection information through HH surveys;
- Low interplay of indicators within the Protection LSG composite indicator;
- Low prevalence of protection issues in some specific areas.

100% of households were found to have at least one LSG severity score and/or a CG severity score of at least 3:

- 68% of households were found to have at least one LSG severity score of at least 3 but a CG severity score lower than 3;
- 29% of households were found to have both at least one LSG severity score and a CG severity score of at least 3;
- 3% of households were found to have all LSG severity scores lower than 3 but a CG score of at least 3.
**ANNEX 1: METHODOLOGY**

The Multi-Sector Needs Assessment (MSNA) is a crisis-wide assessment that aims to provide a broad understanding of humanitarian needs in the areas and for the population groups assessed. In North-East Nigeria, for the 2nd year in a row, REACH facilitated this MSNA in all the accessible areas, and covering all population groups in Borno, Adamawa and Yobe States - non-displaced, IDP and returnee households. Due to the deteriorated security environment, the 2019 MSNA had a lower geographical coverage than the 2018 MSNA. Notably, teams could not cover Abadam, Guzamala, Kawala, Marte, and Ngannai LGAs in Borno State; as well as Geidam LGA in Yobe State. More than a mere logistical impediment to field operations, this should be considered as a finding in itself.

The Multi-Sector Needs Index (MSNI) is an analysis approach proposed by REACH for the 2019 MSNAs, which incorporates some elements of the draft Joint Inter-Sectoral Analysis Framework (JIAF), an analytical framework being developed at global level aiming to enhance understanding of needs of affected populations at a more inter-sectoral level. The Nigeria MSNA analysis tried to follow as much as possible the draft JIAF: the Context informed by a secondary data review developed jointly with sectors through the Information Management Working Group (IMWG); the Event and Shock pillar also informed by the secondary data review and primary data collection on household vulnerabilities; the Impact pillar informed by a composite indicator looking at impact on people, on systems and services, and on access; and finally the Humanitarian Conditions pillar informed by the sectoral analysis as well as inter-sectoral indicators such as the coping capacity gap. This MSNI analysis is considered an interim approach until the JIAF is fully endorsed and implemented at the global level.

More information about the MSNA can be found in these research Terms of Reference (ToRs).

---

**MSNI decision tree**

1. Take the largest individual LSG score between health/ protection/shelter
2. Replace it with the household impact score, if lower than previous score
3. Replace it with the score of [health AND protection] OR [health AND shelter] OR [shelter AND protection], if higher than previous score
4. Replace it with the WASH, FSL OR capacity gap score, if higher than the previous score
5. If final score is 1 but individual LSG score of health, protection/shelter education is >3, household score increased by one scale i.e. 1→2

**Rationale for MSNI decision tree - progressive deterioration of a household’s situation towards the worst possible humanitarian outcome:**

- Initial shock hits household (HH) 
- HH living standards affected (for e.g. shelter needs, security concerns, access to education or healthcare), but has resources/is coping to meet basic needs
- Complete collapse of HH living standards and coping capacities used to meet basic needs
- HH living standards deteriorated to the extent that it is unable to meet day-to-day survival needs (i.e. food and water), or relying on severe, negative coping mechanisms to meet these needs
- Increased risk to HH’s physical and mental well-being, likelihood of heightened mortality within HH

ANNEX 2: HOW TO READ A SUNBURST DIAGRAM

The sunburst diagram shows hierarchical data. Every level of the hierarchy is represented by one ring or circle with the innermost circle as the top of the hierarchy.

The innermost circle represents the proportion of households categorised with a MSNI severity score of at least 3 (or, in the case of groups/areas of particular concern, the proportion of households categorised with the highest MSNI severity score).

The ring immediately surrounding the innermost circle shows the proportion of households whose MSNI severity score (of at least 3) was primarily driven by:

a) Living Standard Gap (LSG) in food security/ livelihoods or WASH; OR
b) Capacity gap; OR
c) Co-occurring LSGs in health and shelter, or health and protection, or shelter and protection; OR
d) LSG in health, or shelter, or protection and have been severely impacted by the event/shock.

The outer ring breaks down the primary divers of the MSNI severity score (above) even further, by showing the breakdown of the proportion of households:

i. Within a) (above) whose needs were driven by an LSG in food security, or WASH, or both;
ii. Within c) whose needs were driven by co-occurring LSGs in either health and shelter, or health and protection, or shelter and protection, or all three sectors
iii. Within d) whose needs were driven by an LSG in health, or shelter, or protection, in addition to an impact of the event/shock on households.

Example:

“In Borno, 72% of households overall were found to have severe or extreme humanitarian needs (MSNI severity score 3 or 4). For a majority of those households (83%) these needs were primarily driven by a living standards gap (LSG) in FSL and/or WASH, with in particular 44% of households whose needs were primarily driven by an LSG in WASH, 23% of households whose needs were primarily driven by an LSG in FSL, and 16% by combined LSGs in FSL and WASH. For 13% of households with an MSNI severity score of 3 or 4, those needs were primarily driven by capacity gaps, which entail a high reliance on negative coping strategies. The remaining 4% of households with an MSNI severity score of 3 or 4 had needs primarily driven by a co-occurrence of at least two LSGs in health, protection, shelter (2%) and the added impact of the crisis with two of the previous LSGs (2%)”

About REACH:
REACH Initiative facilitates the development of information tools and products that enhance the capacity of aid actors to make evidence-based decisions in emergency, recovery and development contexts. The methodologies used by REACH include primary data collection and in-depth analysis, and all activities are conducted through inter-agency aid coordination mechanisms. REACH is a joint initiative of IMPACT Initiatives, ACTED and the United Nations Institute for Training and Research - Operational Satellite Applications Programme (UNITAR-UNOSAT).
