## EARTHQUAKE RESPONSE **RAPID NEEDS ASSESSMENT**

15 February - Updated on 30 March 2023 | Northwest Syria

### **KEY MESSAGES**

- Key reported needs for newly arrived IDPs were winterisation and shelter support, while winterisation and multi-purpose cash assistance (MPCA) were most reported for pre-earthquake populations in affected communities.
- Damage was particularly often reported in Greater Idleb near the Turkish border, and in Afrin district in Northern Aleppo. Residential buildings were reportedly strongly impacted.
- Access to key services was reportedly low, with no access to healthcare reported in 21% of assessed communities which were directly impacted, and no access to water reported in 11%.

### METHODOLOGY OVERVIEW

This RNA was conducted using a key informant (KI) methodology at the community level. REACH enumerators based in Idleb and partners' enumerators based in Northern Aleppo interviewed 1 KI per community, either in-person or remotely, relying on REACH's extensive KI network in NWS. The situation overview presents information gathered from 754 communities across Greater Idleb and Northern Aleppo. Data was collected between 9-11 February 2023 from 604 KIs, with a second round of data collection conducted by Save the Children's third-party monitors between 7-9 March 2023 from 150 KIs in five sub-districts that were not assessed in the first round.<sup>3</sup> All indicators refer to the situation since the earthquake. Findings are indicative rather than representative and should not be generalised across the population and the region.

#### You can keep up-to-date with REACH's latest earthquake-related information products by checking our IMPACT communications thread.

<sup>2</sup> UN Office for the Coordination of Humanitarian Affairs (OCHA) (March 8, 2023), North-West Svria; Situation Report (8 March 2023)

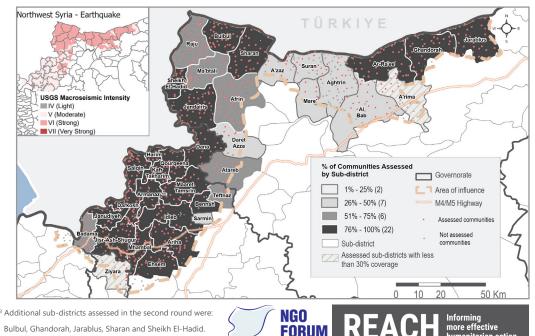

### **CONTEXT & RATIONALE**

Two earthquakes hit south-eastern Türkiye on 6 February, with a magnitude of 7.7 and 7.6, respectively. To date, more than 50,000 people are estimated to have died in Türkiye and Northwest Syria (NWS),<sup>1</sup> including 4,500 deaths and 8,700 injuries in NWS.<sup>2</sup> These earthquakes have resulted in damage to both residential buildings and critical infrastructure, some of which was either completely destroyed or severely damaged.

SITUATION OVERVIEW

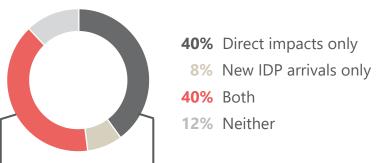

In the aftermath of the earthquakes, it is paramount to have reliable information to assess the conditions of the affected areas and population. To inform the humanitarian response, REACH has developed a rapid needs assessment (RNA) to analyse the scope and scale of the earthquakes' impact on affected residents and newly-arrived IDPs in communities across NWS. The RNA aims to inform early stages of NWS earthquake response and support initial prioritisation and planning.

### **COVERAGE MAP**

# COMMUNITIES AFFECTED BY THE EARTHQUAKES AND IDP ARRIVALS, AS REPORTED BY KIS

% of assessed communities where KIs reported direct earthquake impacts (damage/service disruption) or arrival of new IDP HHs

All assessed communities where KIs reported direct impacts had <u>composite</u> <u>damage</u> scores above zero, reflecting that at least some degree of damage had occurred to buildings and/or key infrastructures.

### REPAIR, REHABILITATION, AND DEBRIS REMOVAL NEEDS

**Overall most commonly reported priority needs for non-shelter-related repair and rehabilitation** (by % of 602 assessed communities reporting direct earthquake impacts) <sup>2,3</sup>

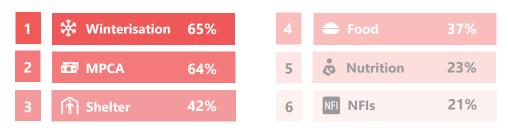

1	<b>Water supply</b> network	41%		3			Telecomms and internet	38%
1	Education facilities	41%		4		<b>A</b>	Healthcare facilities	35%
2	Electricity networks	41%		5			Sanitation infrastructures	32%
<b>270/</b> in which KIs reported the community needs								

assistance to clean up debris/rubble created by the earthquake

### PRIORITY NEEDS FOR AFFECTED HOUSEHOLDS

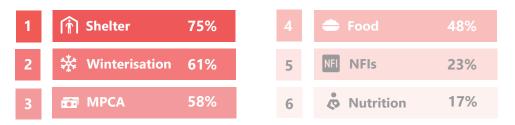

**Overall most commonly reported priority needs for the pre-earthquake**<sup>4</sup> **population** (by % of 602 assessed communities reporting direct earthquake impacts) <sup>2,3</sup>

## **Overall most commonly reported priority needs for newly-arrived IDPs** (by % of 354 assessed communities reporting new IDP arrivals) <sup>2,3</sup>

#### Ability of households to cook and store food

(by % of communities that selected food as a top 3 need for new IDPs (170) and pre-earthquake population (220))

		Å→
52%	Majority can both cook and store food	43%
31%	Majority can cook food only	34%
13%	Majority can neither cook or store food	19%
4%	Majority can store food only	4%

<sup>2</sup> KIs were asked to select a first, second, and third highest priority needs in their communities. The ranking shows the overall priority need refers to the frequency a sector was selected across all three categories (first, second or third highest priority).

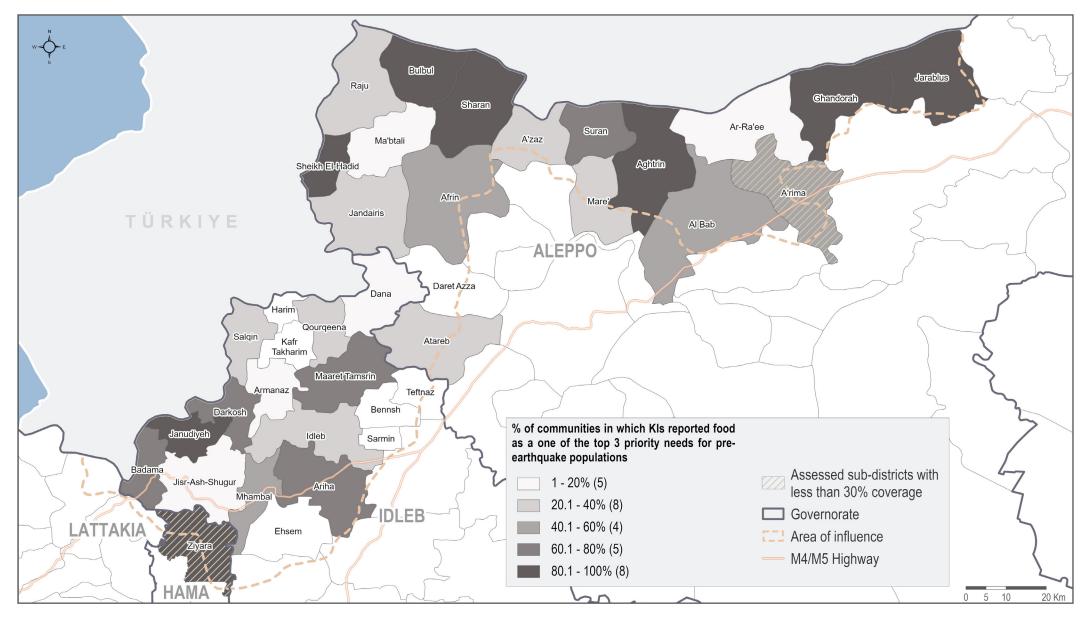

<sup>3</sup> KIs could select three answers, thus findings might exceed 100%.

Communities

<sup>4</sup> Pre-earthquake population includes all persons who were residing in the assessed communities at the time of the earthquakes, including resident/host community members and IDPs.

# Average estimated proportion of newly arrived IDPs by type of shelter they were residing in at the time of data collection (as reported

by KIs in 354 communities that received new IDPs)

Hosted for free by friends/relatives	70%
Residing in functioning tents	13%
Staying in vehicles	4%
Residing in unfinished/ damaged buildings	3%
Residing in makeshift shelter	1%
Collective centres outside of education or health facilities	5%
Collective centres in educational facilities	3%
Collective centres in health facilities	1%

### Estimated IDP movements between sub-districts since the

**earthquakes** (based on KI information on the primary community of origin; 319 assessed communities with new arrivals and where origin was known)

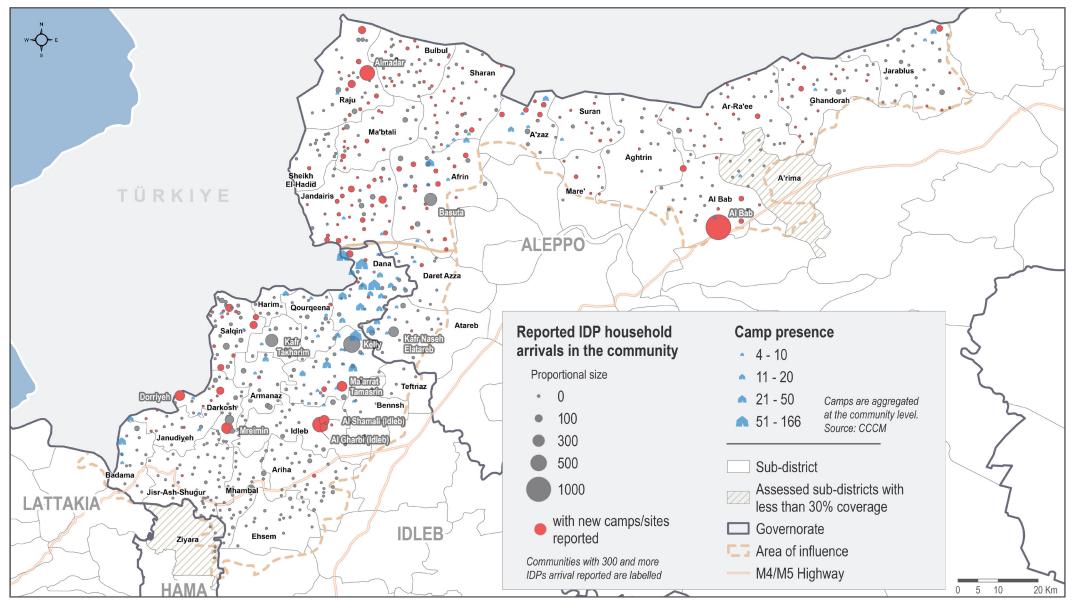

Sub-district of Origin	Sub-district of Arrival	# of assessed communities in sub- district of arrival where KIs reported the main community of origin in the sub-district of origin	For these communities, estimated total number of IDP arrivals
Salqin	Salqin	25	1,400
Jandairis	Jandairis	21	1,200
Jandairis	Afrin	19	800
Afrin	Bulbul	14	100
Jandairis	Bulbul	12	200
Jandairis	Sharan	12	200

Communities in which KIs reported that the **main community of origin for new IDPs was outside of their sub-district** (as reported by KIs in 319 communities that received new IDPs and knew primary area of origin)

### MAP 7: ESTIMATED NUMBER OF IDP ARRIVALS (HOUSEHOLDS) BETWEEN 6 FEBRUARY AND TIME OF DATA COLLECTION

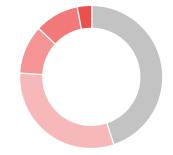

### **SHELTER & NFI**

### Average reported share of residential buildings per damage

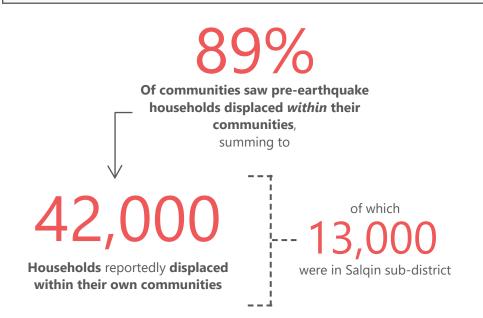

**category<sup>5</sup> following the earthquakes** (by % of 602 assessed communities reporting direct earthquake impacts)

- 44% No damage
- 30% Minor damage
- 12% Major damage
- **11%** Severe damage
- 3% Completely destroyed

Across assessed sub-districts, the highest average proportions of **completely destroyed** residential buildings were reported in **Jandairis** (15%) and **Harim** (9%).

KIs in assessed communities of **Ghandorah**, **Janudiyeh**, **Bulbul**, **Jandairis** and **Sheikh El-Hadid** sub-districts reported the highest averages for percentage of residential buildings severely damaged, with averages of 29%, 25%, 23%, 21% and 20% of residential buildings **severely damaged**, respectively.

# Average estimated proportion of pre-earthquake households displaced within their community by type of shelter they were

**residing in** (by % of 329 assessed communities reporting direct earthquake impacts and HHs displaced within the community)

Collective centres in educational facilities 2%

Collective centres in health facilities 0%

62,000<sup>\*</sup> HHs

Estimated number of households in need of **tents and emergency shelter at collective centres**, as reported in 504 communities where KIs were able to provide estimates (for both the pre-earthquake population and newly-arrived IDPs)

106,000<sup>\*</sup> HHs

Estimated number of households in need of **mattresses, high thermal blankets, and clothing**, as reported in 539 communities where KIs were able to provide estimates (for both the pre-earthquake population and newly-arrived IDPs)

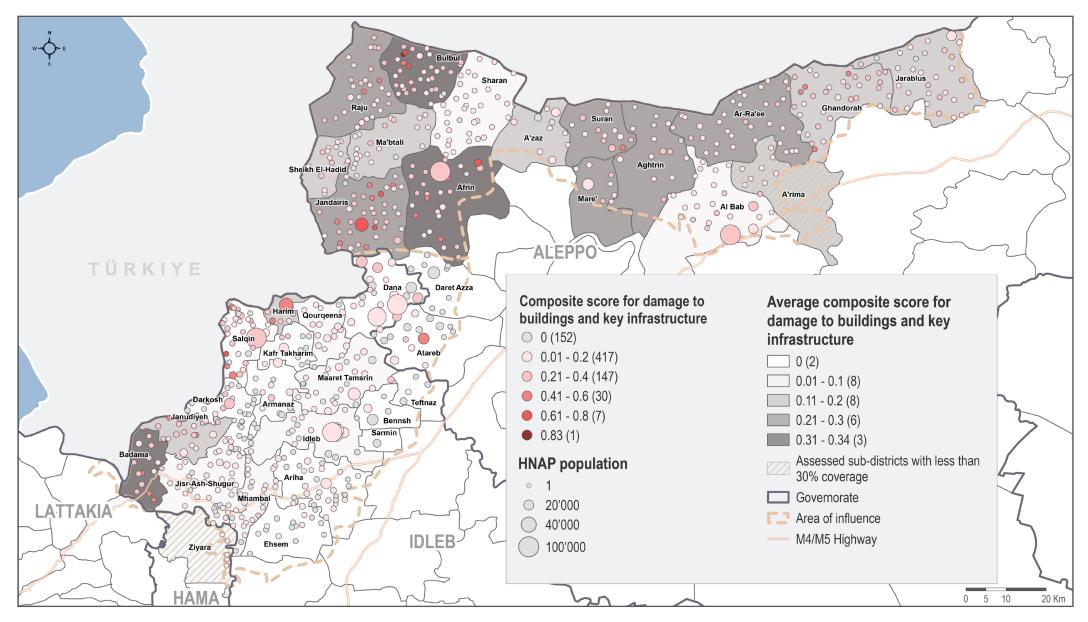

\* Approximate figures

<sup>5</sup> Building damage definitions: Completely destroyed - Structural damages so significant that rehabilitation is not possible; Severe damage - Significant structural damage to columns, slabs, or load-bearing walls, cracking, steel elements and deformations visible in concrete - building requires extensive repairs; Major damage - Extensive damage to window frames and doors, but no structural damage to columns, slabs, or load-bearing walls; Minor damage - Cracks in walls, leaking roof, need of new doors & window repairs, etc.

### MAP 8: DAMAGE TO BUILDINGS AND KEY INFRASTRUCTURE

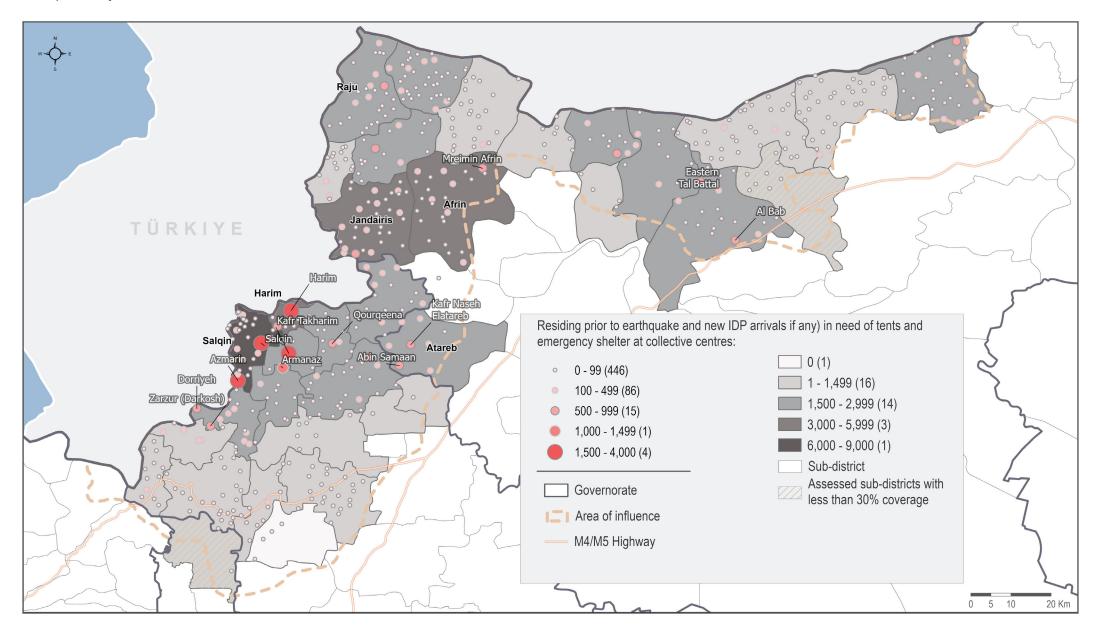

Composite score<sup>6</sup> of KI damage estimates for residential buildings and key types of infrastructure (see Annex for methodology description)

<sup>6</sup> This score combines information on the level of damage of key infrastructure. Specifically, residential buildings, markets, health facilities, water networks/ wells, roads, electricity networks, telecommunications/ internet infrastructure, and education facilities are included. Residential buildings, markets, health facilities, water networks/ wells, and roads are weighted twice as highly. A score of 0 indicates that no infrastructure was damaged while a score of 1 indicates that all infrastructure was completely destroyed.

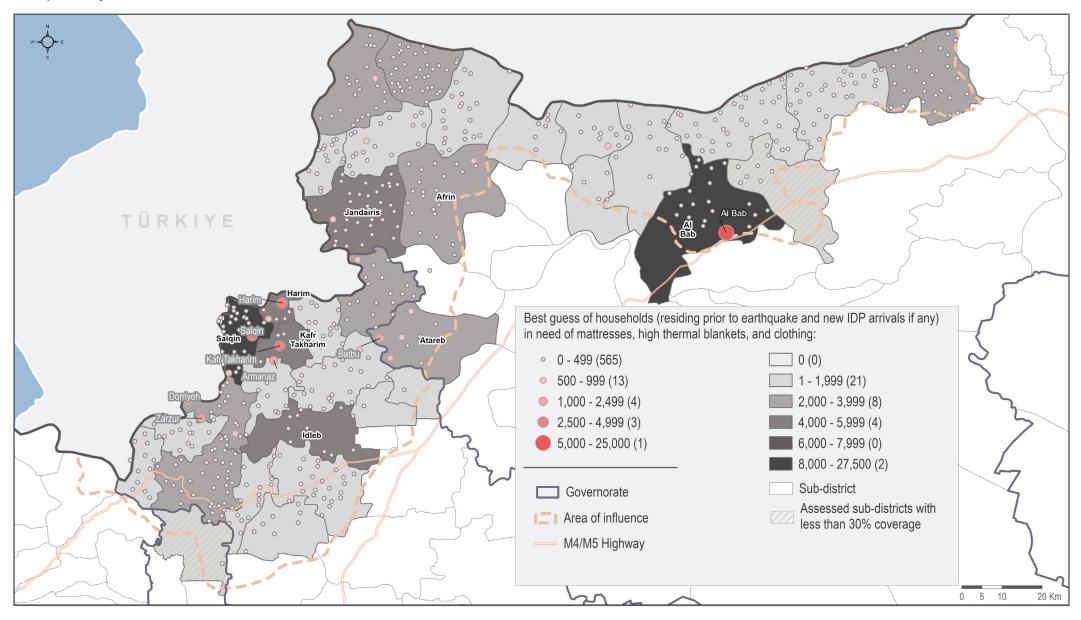

### MAP 9: ESTIMATED NUMBER OF HOUSEHOLDS IN NEED OF TENTS OR EMERGENCY SHELTER AT A COLLECTIVE CENTRE

### MAP 10: ESTIMATED NUMBER OF HOUSEHOLDS IN NEED OF MATTRESSES, THERMAL BLANKETS, AND WINTER CLOTHING

### **KEY SERVICE ACCESS**

**Reported levels of access to key services** (by % of 602 assessed communities reporting direct earthquake impacts)

	Accessible to all	Accessible to most	Accessible to half	Accessible to few	Accessible to none
Water Services	39%	30%	9%	9%	12%
Electricity Services	23%	28%	10%	7%	33%
Health Services	28%	19%	14%	15%	25%
Markets	47%	29%	12%	7%	5%

### Accessibility of main services for the three sub-districts with most

**Severe access scores**<sup>7</sup> (by % of communities reporting services accessible to all, most, half, few, or none of the population)

		Accessible to all	Accessible to most	Accessible to half	Accessible to few	Accessible to none
	Water Services	6%	29%	13%	6%	45%
Bulbul	Health Services	4%	0%	4%	33%	59%
	Markets	10%	30%	13%	23%	23%
Ghandorah	Water Services	12%	23%	12%	23%	31%
	Health Services	12%	12%	12%	27%	38%

### ABOUT REACH

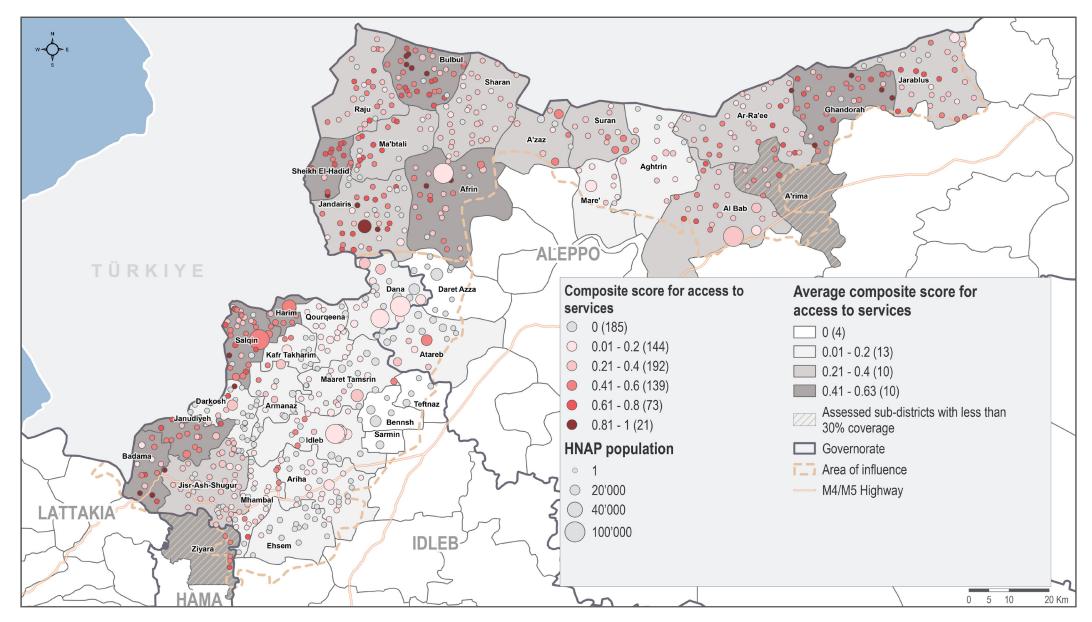

REACH Initiative facilitates the development of information tools and products that enhance the capacity of aid actors to make evidence-based decisions in emergency, recovery and development contexts. The methodologies used by REACH include primary data collection and in-depth analysis, and all activities are conducted through inter-agency aid coordination mechanisms. REACH is a joint initiative of IMPACT Initiatives, ACTED and the United Nations Institute for Training and Research - Operational Satellite Applications Programme (UNITAR-UNOSAT).

<sup>7</sup> This score combines information on the proportion of people in the community that were able to access services for water, health, electricity, sanitation, telecommunications/ internet, education, and markets. Water, health, and markets are weighted twice as highly. A score of 1 indicates that nobody in the community was able to access any of the services. A score of 0 indicates that all services were accessible by all households, or that the community was not impacted by the earthquakes.

### MAP 11: POPULATION ACCESS TO KEY SERVICES

Composite score<sup>8</sup> of KI access estimates for key types of services (see Annex for methodology description)

<sup>8</sup> This score combines information on the proportion of people in the community that were able to access services for water, health, electricity, sanitation, telecommunications/ internet, education, and markets. Water, health, and markets are weighted twice as highly. A score of 1 indicates that nobody in the community was able to access any of the services. A score of 0 indicates that all services were accessible by all households, or that the community was not impacted by the earthquakes.

### ANNEX 1: Composite Scores – Methodology Notes

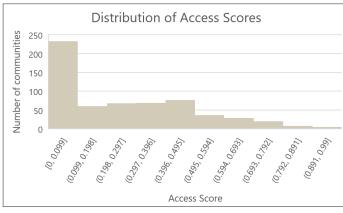

#### **Access Score**

The aim of this composite indicator is to summarise whether households in communities are struggling to access essential services.

Key informants were asked what proportion of households in their community were able to access specific services. These services were water, health, electricity, sanitation, telecommunications and internet, education, and markets. As the focus was on essential services necessary for survival, several sectors were weighted more heavily in the composite. Specifically, these are water, health, and market services, where markets are an indication of food availability. For simplicity, the weight for these sectors was twice as high as for the others.

The answer options to the question were that all households, most, half, less than half, or none were able to access the service. These were translated into numerical values between 0 and 1, where "none" received a score of 1 (highest severity) and "all" received a score of 0 (lowest severity). Key informants also had the option to indicate that they did not know the proportion. In these cases, the average of the subdistrict was used.

The final score was then calculated as a weighted average, i.e. the sum of all service scores divided by the sum of the weights. For communities that reported no impact from the earthquake, the score was set to 0.

#### **Damage Score**

The aim of this composite indicator was to give an idea of the extent of damage to residential buildings and essential infrastructure in communities.

Key informants were asked what percentage of buildings or infrastructure type fell into each damage category. The structure types included here were residential buildings, markets, health facilities, water networks/ wells, roads, electricity networks, telecommunications/

internet infrastructure, and education facilities. Other infrastructure types were also assessed, notably sanitation networks, but were excluded either because too few communities had this infrastructure type, or because categories overlapped. Furthermore, for water infrastructure, the average of damage to water networks and wells was used. This is because many communities only had one of the two water sources. Please note that secondary data suggests that water trucking is one of the most common sources of water; however, damage to these could not be captures as this largely originates in damage to road and water infrastructure outside of the assessed community.

As the focus was on essential structures necessary for survival, several types of buildings and infrastructure were weighted more heavily in the composite. These were residential buildings, markets (as an indication of food availability), health facilities, water, and roads. For simplicity, the weight for each of these sectors was twice as high as for the others.

The answer options were the proportions of the infrastructure that fell into each of the damage categories – completely destroyed, severe damage, major damage, minor damage, and no damage. The damage categories were transformed into numerical values where completely destroyed is 1 and no damage is 0. Using the percentages given by the KIs, we calculated the average damage to the infrastructure. Where the infrastructure didn't exist, this value was left empty. Where the key informant said that they did not know the level of damage, the value was imputed using the average damage to that infrastructure in the subdistrict.

The final score was then calculated as a weighted average, i.e. the sum of all service scores divided by the sum of the weights. For communities that reported no impact from the earthquake, the score was set to 0.
