General Objective	To inform evidence-based humanitarian programming and service delivery in the short and long-term at the urban area-level in Telafar through an area-based assessment and collaborative response planning.	
Specific Objective(s)	<ul style="list-style-type: none"> • Define and profile the geography and demography of the area selected for assessment. • Identify and map the availability and accessibility of services within the area of assessment, highlighting key gaps and barriers to service provision for affected populations. • Gauge the perceptions and expectations of residents regarding service delivery and reconstruction efforts. • Evaluate household-level priority multi-sectoral needs of the affected population within the area of assessment. • Understand challenges to achieving durable solutions for affected populations in the area of assessment.² • Conduct a comprehensive gap analysis and support the development of collaborative response plans to ensure an evidence-based localized response. 	
Research Questions	<ol style="list-style-type: none"> 1. What is the demographic and geographic profile of the population within the area of assessment? 2. What is the current availability, functionality, and accessibility of services and infrastructure in the area, and how does this compare to before June 2014?³ 3. Where are functional services and infrastructure located within the area of assessment? 4. What are the primary obstacles to accessing services, from the perspective of community members? 5. What are the primary obstacles to delivering services, from the perspective of providers? 6. What are the multi-sectoral needs of the population within the area of assessment? 7. What are the challenges to achieving durable solutions for affected populations in the area of assessment? 8. What are the primary gaps in provision of services and targeting of assistance? 	
Geographic Coverage	Telafar city	
Secondary data sources	<ul style="list-style-type: none"> • Population data (e.g. IOM Displacement Tracking Matrix's Integrated Location Assessment [ILA] and Return Index) • Data and reports from previous needs and vulnerability assessments (e.g. UNHCR Protection Monitoring, etc.) • General background and context research on areas being targeted for assessment • Geo-spatial data (e.g. UNOSAT satellite imagery) • Tools and Lessons Learned from previous ABAs • Relevant REACH Initiatives assessments (e.g. 2018 Telafar ABA) • 4W, to be prepared by CRC lead agency (ACTED) 	

² This assessment will draw from the IASCs durable solutions framework in terms of categorization and assessment of the level of social cohesion and barriers to integration for displaced and/or returnee populations.

³ June 2014 represents the date the city of Telafar was occupied by the Islamic State.

⁴ Individuals that were displaced from the area following the 2014 crisis and have since returned.

⁵ Three quotas will be developed: (1) displacement status (e.g. returnee, non-displaced, IDP), (2) sex of head of household (e.g. male, female) and (3) neighborhood of residence.

⁶ It is estimated that there are approximately 17,000 households in Telafar city. The sample size provided above matches what a representative sample at a 99% confidence level and 5% margin of error, with a 20% buffer, would yield. Though the sample will not be statistically representative, reflecting the methods through which it is developed, a sample size that is closer to a representative level will ultimately be more precise in capturing the circumstances of households in the city. Considering the sample will not be representative, a high confidence level (99%) has been selected to increase precision.

⁷ This figure represents the number of community leaders in the city of Telafar. Though there are 25 designated neighborhoods, in some instances one community leader is responsible for more than one neighborhood.

⁸ The ABA will interview experts across seven sectors: education, electricity, healthcare, solid waste disposal, water, livelihoods, and legal matters. Four SMEs will be interviewed for each of these sectors.

2. Rationale

2.1. Rationale

During 2020, Iraq will continue to see an increasing rate of returns of internally displaced populations (IDPs) to their areas of origin. Returnees often face pronounced challenges in returning to their areas of origin, including insufficient or non-functional services, constricted or absent livelihoods, friction with other communities, and a lack of support from key state or non-governmental actors. In response to these challenges, humanitarian actors have mobilized to provide the support needed by vulnerable populations and the platforms to deliver this assistance. In particular, the humanitarian community in partnership with the Joint Coordination and Monitoring Center (JCMC), on behalf of the Iraqi Government, established the [Community Resource Centers \(CRCs\) Initiative](#). The CRC strategy aims at enhancing area-based and multi-sectoral engagement in areas where conflict-affected communities reside and return to, and to facilitate the dialogue and engagement of different government, humanitarian, and development actors in the identification of durable and safe solutions to displacement. CRCs are commonly established in areas of high return, allowing them to support communities in identifying and accessing activities, provide two-way information access and dissemination, support multi-sectoral coordination among humanitarian actors and the government, and promote an area-based approach to displacement management.

Through an area-based approach, humanitarian actors can operate at a more localized level to design a response that is geographically targeted, inclusive of a range of local, international, and governmental actors, and is inter-sectoral in its programme delivery. To support a collaborative and localized response, humanitarian, development and government actors require a strong evidence base that is multi-sectoral, and can inform short, medium and long-term interventions in the area. To date, REACH Initiative (REACH) has provided an initial evidence base through one round of Area Based Assessments (ABAs), from September 2018 to November 2019, conducted in urban areas as CRCs are being established. The ABA framework combines secondary data with primary data collection to fill informational gaps regarding the provision and availability of services and household-level multi-sectoral needs. As the assessment has developed, and in response to partner need, REACH has also assisted in conducting gap analysis, through comparing data with area-based 4Ws, to highlight priority gaps in the response.

However, through this process, further information gaps and partner needs have emerged, namely the need to more systematically conduct gap analysis and feed this into a collaborative response planning process at the local level. Furthermore, the response in areas of return has begun to focus on longer term issues such as social cohesion, while meeting shorter or medium term needs of affected populations. In light of these lessons learned, REACH's initial ABA approach has been expanded to include support to collaborative response planning processes, and durable solutions indicators, to better meet the needs of the CRC implementing partner as well as local humanitarian, development, and governmental actors.

To operationalize this recognition of the need for gap analysis and monitoring, REACH has designed an expanded ABA approach. Built on the strengths of previous ABAs, this new framework uses a collaborative approach to response planning, employing a gap analysis with OCHA's 4W. For the first round of this ABA and collaborative response planning approach, REACH will focus on Telafar city. The circumstances of Telafar, located in Ninewa Province, are emblematic of the challenges in supporting returnees and the broader population in areas of high return. Before its capture by ISIS in June 2014, an estimated number of 200,000-220,000 people lived in the city. Though the majority of residents were Sunni Turkmen, the city's population included a variety of ethnic (e.g. Arabs, Kurds) and religious groups (e.g. Shi'a, Christian).

Following the capture by ISIS, the city was virtually depopulated and by April 2018, one year after liberation, only 30 – 40% of the pre-conflict population (i.e. 60,000 – 80,000 residents) had returned. Those who returned reported limited availability of services, widespread food insecurity, a dearth of livelihoods, and a population of children who had not attended school for three years. In 2019, a CRC was re-established in Telafar⁹ and has served as a resource centre, supporting the operations of humanitarian partners in the city. Through the expanded ABA approach, described in the present TOR, with its collaborative response planning framework and continuous monitoring, REACH will continue to inform the CRC and promote evidence-based responses to the needs of the population.

3. Methodology

3.1. Methodology overview

The ABA will employ a mixed methods approach that combines the analysis of secondary data with both quantitative and qualitative primary data collection methods in the form of:

- Key Informant Interviews (KIIs)
 - 23 community leader KIIs
 - 28 SME KIIs
- Household-level surveys
 - 780 surveys

Data collection is planned to take place in September and October. It will commence with KIIs with the community leaders of the 25 official neighbourhoods of Telafar, which have been identified in previous ABAs and consultations with ACTED staff.¹⁰ The goal of these KIIs will be to obtain population data for survey sampling, contact information on potential household survey participants, and information on the availability and functionality of services in each neighbourhood. KIIs with community leaders will also serve to identify Subject Matter Experts (SMEs) who, through subsequent KIIs, will provide detailed information on availability and quality of services and infrastructure, and related topics. A total of 28 SMEs will be interviewed, four per sector of interest.¹¹

In addition to the community leader and SMEs KIIs, a household needs and vulnerability survey will be conducted. For this purpose, 780 household interviews will be conducted using a structured questionnaire. This sample size reflects what a statistically representative survey would yield at a 99 percent confidence level, 5 percent margin of error, and 20 percent buffer. Though the survey will not be statistically representative, reflecting the purposive methods through which it is conducted, a sample size matching one developed through statistical methods will ultimately be more precise in assessing the circumstances of households in the city. Potential participants will be identified through snowball and quota sampling, where contact information is solicited from community leaders and other survey participants, as well as through contact details available from previous assessments and, potentially, data sharing agreements with partners. Reflecting access restrictions that have precluded in-person household surveys, REACH has opted to pursue a remote call methodology for all data collection that will be informed by IMPACT's [SOPs for Data Collection during COVID-19](#) where applicable. It is expected that all data collection activities will take between four and six weeks.

Data collection for the ABA will be followed by the development of the gap analysis, developed through review of the local 4W, prepared by the CRC lead agency. The framework for the analysis of severity of need will, as far as possible, mirror that of the national HNO and HRP processes in order to translate information and activities at the local level into national level coordination strategies. This activity is expected to take three weeks, beginning in November 2020. Afterwards, the findings of the gap analysis will be presented, in partnership with the CRC lead agency, to international and local actors in Telafar in a one-day workshop designed to identify priorities, gaps, and overlap in response and brainstorm appropriate responses. Following the gap analysis and workshop, REACH will produce an Overall Area Profile, which will provide a summary of the city's communities, findings and gap analysis, and priorities. This final activity is expected to be completed by February 2021.

⁹ A CRC was first established in 2018, though it closed owing to budgetary issues.

¹⁰ Though there are 25 designated neighborhoods, in some instances one community leader is responsible for more than one neighborhood. The number of community leader KIIs represents the number of community leaders in the city of Telafar.

¹¹ Education, electricity, healthcare, solid waste disposal, water, livelihoods, and legal matters.

The following sectors will be addressed by the various components of the ABA: solid waste management, provision of water, provision of electricity, education, healthcare, livelihoods, food security, assistance, shelter, and protection, as well as key intersectoral and durable solutions indicators¹².

3.2. Population of interest

All population groups residing in the urban area assessed, including:

- Internally displaced persons (IDPs) residing in and out of camps – including those in informal sites
- Non-displaced
- Returnees

These population groups are categorized using IOM DTM definitions: IDPs are those who have been displaced out of their subdistrict of origin, and remain in their area of displacement; returnees are those who were displaced from their subdistrict of origin, but have returned; non-displaced are those who were not displaced from their subdistrict of origin.

3.3. Secondary data review

A secondary data review (SDR) will be conducted by REACH in order to support the implementation of primary data collection, analysis, and operationalization of findings. Sources will include:

- Population data (e.g. IOM Displacement Tracking Matrix's [Integrated Location Assessment](#) [ILA] and [Return Index](#))
- Data and reports from previous needs and vulnerability assessments (e.g. UNHCR Protection Monitoring, etc.)
- General background and context research on areas being targeted for assessment
- Geo-spatial data (e.g. UNOSAT satellite imagery)
- Tools and Lessons Learned from previous ABAs
- Relevant REACH Initiatives assessments (e.g. [2018 Telafar ABA](#))
- 4W, to be prepared by CRC lead agency

3.4. Primary Data Collection: Full ABA rounds

3.4.1. Selection of areas to be assessed

The urban area of assessment (entire city, municipality, neighbourhood) will be chosen in collaboration with the CRC Steering Committee (CRC SC). As the definition of “urban area” is heavily dependent on the context in which a planned CRC is located, it can range from a municipality within a city to a smaller city and adjacent settlements. Therefore, the scope of the area will be determined on a case-by-case basis, which will be outlined in final outputs. As assessment areas will be selected by CRC partners, and as there are no reliable population figures for settled areas of Iraq, no minimum size can be identified.

3.4.2. Sampling

Key Informant Interviews (KII)

Purposive sampling methods will be employed for the KII components of the assessment. REACH enumerators will utilize existing KI networks and partner contacts to identify the 23 community leaders¹³ for the 25 neighbourhoods already identified, as well as four subject matter experts (SMEs) each in the fields of healthcare, education, water, electricity, solid waste disposal, livelihoods, and the legal sector with comprehensive knowledge of their area of responsibility.¹⁴ Any remaining

¹² Indicators for Durable Solutions will be informed through previous assessments by REACH, as well as leading experts in the field, principally the Inter-Agency Standing Committee.

¹³ In the context of Iraq, each community (whether neighborhood, village, or town) is represented by a mukhtar. For the purposes of these KIIs, mukhtars represent the most prominent respondent type of community leaders.

¹⁴ Sector experts include: healthcare (doctors, nurses, pharmacists, medical assistants); education (teachers, head teachers, education ministry employees); water (municipal employees, water engineers, NGO employees); electricity (municipal employees, ministry employees, NGO employees); solid waste (municipal employees, NGO employees); livelihoods (business figures, trade organization representatives, chamber of commerce members).

gaps will be filled by using a snowballing approach to identify additional participants until all (if possible) identified locations or sectors of knowledge within the assessment area are represented.

Structured Household-level Needs and Vulnerability Survey

Accurate population data for most areas of Iraq is limited, both in terms of overall population, figures by population group (IDP, non-displaced, returnee etc.) and at the neighbourhood/municipal/village level. Therefore, to facilitate the development of a sampling framework, REACH will use population figures provided by the KIIs conducted in the qualitative part of the assessment. This data will also be used to triangulate secondary data from other sources where available.

As REACH will not be able to physically access the city of Telafar, a randomized probability sample will not be possible. Instead, REACH will employ a non-probability sample, drawing on snowballing and quota sampling techniques. As a first step, the call list of potential participants will be developed through secondary sources, including previous REACH assessments and, potentially, the resources of partners. The call list will be supplemented through snowballing techniques, chiefly enumerators soliciting contact information of potential participants through community leader KIIs and HH surveys with other participants. By using as diverse a range of sources as possible in developing the contact list, REACH will reduce the bias in selecting respondents through snowball sampling.

As the assessment will employ a non-probability sample, data will not be statistically representative. However, to achieve a greater degree of representativeness, closer to what an actual representative sample would yield, REACH will use quota sampling to augment snowballing. Quota sampling is a non-probability version of stratified sampling, where the population of interest is divided according to sub-groups that reflect their overall proportion in the population. For the ABA, three quotas will be developed: (1) neighbourhood, (2) displacement status of household (IDP, non-displaced, returnee) and (3) sex of head of household (male, female). Proportions for the first two quotas will be calculated through information provided in community leader KIIs, while the third will be calculated through existing datasets. As much as possible, REACH will select participants to meet the proportions developed for each type of quota.

2.4.3. Field Data Collection

Key Informant Interviews (KIIs)

- Key informant interviews (KIIs) will be conducted with community leaders, as well as municipal and local service providers (SMEs). Community leaders, reflecting their role in the neighbourhood, will be asked questions across all sectors (e.g. education, electricity, legal services), while SMEs, reflecting their knowledge of one particular sector, will be asked questions on their specific area of knowledge.
- Interviews will be conducted by phone, depending on logistics, resources, and security/access restrictions, including COVID-19-related restrictions and preventive measures.
- All KIIs will be conducted through KoBo Collect. A half-day training will be held to review each ODK tool and address any questions or concerns. Debriefing of enumerators will be conducted by REACH assessment staff after interviews.
- At the close of each interview, enumerators will ask community leaders whether they wish to provide contact information on potential participants in the HH survey. They will ask specifically if the interviewee can suggest a potential participant who lives in the same neighbourhood and if they can provide information on the displacement status and sex of the head of household, according to the quotas developed.

Household Needs and Vulnerability Survey

- Data collection will be implemented by REACH enumerators, who will collect household-level data through a comprehensive multi-sectorial tool built from indicators from previous ABAs and other relevant assessments. The interviews will be conducted through phone calls.
- Though the surveys will be conducted at the household level, the questionnaire will include questions on individuals within the household (e.g. possession of certain documents, disability status). This is advisable as households in the Iraqi context are large, and often consist of multiple families sharing resources and living space. Asking certain

questions at the individual level ensures a greater level of precision and has been proven effective by previous ABAs.

- At the beginning of the interview, enumerators will identify the head of the household. If the head of the household is unavailable, enumerators will interview the next available adult. If no adults are available for interview, the enumerator will not conduct the interview.
- Enumerators will record interview responses digitally using KoBo Collect. At the close of each interview, enumerators will ask participants whether they wish to provide contact information on potential participants. They will ask specifically if the interviewee can suggest a potential participant who lives in the same neighbourhood and if they can provide information on the displacement status of their household and sex of the head of household, according to the quotas developed.

2.5. Data Processing & Analysis

All appropriate methods of quantitative and qualitative data analysis will be used to provide analytical depth to the findings. Quantitative data for all tools will be submitted through the KoBo toolbox after all interviews are completed and cleaned daily by the Assessment Officer (AO). The AO will maintain a cleaning log for each tool in Excel that will record all changes made to the raw data. The AO will conduct a daily debrief with the enumerators responsible for the community leader and SME KIIs, which will serve to review previous calls and resolve any questions raised in data cleaning. For the HH survey, the AO will send the daily cleaning log to the Field Coordinator, responsible for the enumerator team, for clarifications and corrections. The Field Coordinator will return an updated cleaning log to the AO with the relevant corrections to be made or clarifying notes on why no correction is required. Translations will not be required for the community leader and SME KIIs, as data will be entered in English; for the HH survey, whose responses will be recorded in Arabic, translation will be provided by REACH staff.

All quantitative data will be analysed through SPSS. Analysis will be limited to descriptive statistics. The AO will prepare a syntax file, presenting all analysis performed on the data collected, which will be reviewed by IMPACT HQ. Qualitative data will be recorded in open text boxes in the KoBo tool and will be cleaned on a daily basis to resolve ambiguities or provide clarifications. These data will be analysed through a qualitative analysis matrix, which will identify topics and themes raised in response to the question and quantify/classify these as appropriate.

2.6 Gap Analysis and Collaborative Response Planning

Following the completion of primary data collection, REACH will conduct a preliminary analysis in combination with the 4Ws of humanitarian, development, and local actors to produce a gap analysis, at both the CRC area level, as well as the sub-area or neighbourhood level, as necessary. The framework for the analysis of severity of need will, as far as possible, mirror that of the national HNO and HRP processes in order to translate information and activities at the local level into national level coordination strategies

The Preliminary Findings and Gap Analysis will be presented at a one-day workshop, involving international and local actors, service providers, and municipal authorities, and hosted by the CRC. The purpose of the workshop will be to validate findings, identify priorities, share results from the 4Ws exercise, identify gaps and overlaps, and disaggregate responses from international actors. In particular, responses will be disaggregated into immediate, medium and long-term priorities, priorities to be addressed immediately (i.e. those already planned and resourced), and priorities with no committed funding. Through the workshop, REACH will develop an overall area profile, detailing the community profile, assessment findings and gap analysis, and priorities.¹⁵

¹⁵ To be divided according to immediate, medium, and longer-term priorities.

4. Roles and responsibilities

Table 3: Description of roles and responsibilities

<i>Task Description</i>	<i>Responsible</i>	<i>Accountable</i>	<i>Consulted</i>	<i>Informed</i>
<i>Research design</i>	Assessment Officer (AO)	Research Manager (RM)	HQ Research Design and Data Unit (RDDU), Country Coordinator (CC), AWG, CRC SC, CRC implementing partner	Donor
<i>Supervising data collection</i>	AO	AO	ARM, Operations Coordinator	CC, CRC SC, CRC implementing partner
<i>Data processing (checking, cleaning)</i>	AO	AO	RM, HQ RDDU	CC
<i>Data analysis</i>	AO	AO	RM, HQ RDDU, CRC implementing partner and area actors	CC, CRC SC
<i>Output production</i>	AO	AO	RM, HQ Reporting Unit	CC
